Jan,

I have reviewed the data for the validation of the method for determination of acetonitrile in exhalate. Other than a typo in the "Low QC" value in "Representative" row*, I find no issues with these data. The recovery, precision and sample stability look OK.

I do have a question. Is the LLOQ ~6 µg/mL adequate?

I see no reason to hold back moving ahead on this method.

Best Regards,

Don
